Are these two shapes the same?

Are these two shapes the same?

How would we go about proving that they are not?

▲□▶ ▲□▶ ▲ 三▶ ▲ 三▶ - 三■ - のへぐ

The aim of algebraic topology is to translate topological questions into algebraic ones.

Face maps

We can consider maps onto the faces of simplices. These maps help us "glue" the shape back together.

Sac

Let X be a topological space. Consider the set:

 $S_n X = \{ u : \Delta^n \to X : u \text{ is continuous} \}$

Let X be a topological space. Consider the set:

 $S_0X = \{u : \Delta^0 \to X : u \text{ is continuous}\}$

Let X be a topological space. Consider the set:

 $S_0X = \{u : \Delta^0 \to X : u \text{ is continuous}\}$

Let X be a topological space. Consider the set:

 $S_0X = \{u : \Delta^0 \to X : u \text{ is continuous}\} = X$

Let X be a topological space. Consider the set:

 $S_1X = \{u : \Delta^1 \to X : u \text{ is continuous}\}$

So cycles correspond to maps $u \in S_1X$ with $u \circ \delta_0(\Delta_1) - u \circ \delta_1(\Delta_1) = 0$.

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □

So cycles correspond to maps $u \in S_1 X$ with $u \circ \delta_0(\Delta_1) - u \circ \delta_1(\Delta_1) = 0$. For $u \in S_n X$ we define the differential $d_n : S_n X \to S_{n-1} X$ by $d_n(u) = \sum_{i=0}^n (-1)^i u \circ \delta_i$.

So cycles correspond to maps $u \in S_1 X$ with $u \circ \delta_0(\Delta_1) - u \circ \delta_1(\Delta_1) = 0$. For $u \in S_n X$ we define the differential $d_n : S_n X \to S_{n-1} X$ by $d_n(u) = \sum_{i=0}^n (-1)^i u \circ \delta_i$. So an *n*-cycle is a map $u \in \mathbb{Z}S_n X$ with $u \in \ker(d_n)$.

So, two *n*-cycles are to be thought of as the same if they can be "filled in" by a collection of (n + 1)-simplices.

<ロ> <四> <四> <四> <四> <四> <四</p>

Sac

So, two *n*-cycles are to be thought of as the same if they can be "filled in" by a collection of (n + 1)-simplices. Now, $d_2(\bigcirc) = u - v$, so $u - v \in \text{Im}(d_2)$.

So, two *n*-cycles are to be thought of as the same if they can be "filled in" by a collection of (n + 1)-simplices. Now, $d_2(\textcircled{O}) = u - v$, so $u - v \in \text{Im}(d_2)$. So two *n*-cycles are the same iff their difference is in $\text{Im}(d_{n+1})$.

We describe this situation algebraically:

• Both $Im(d_{n+1})$ and $ker(d_n)$ are subgroups of $\mathbb{Z}S_nX$.

From how we've explained it, it is clear that $\pi_1(\mathbb{Z}SX) = H_1(\mathbb{Z}SX)$. However, this is not true in general... Also, $\pi_n(\mathbb{Z}SX)$ is often really hard to calculate!

From how we've explained it, it is clear that $\pi_1(\mathbb{Z}SX) = H_1(\mathbb{Z}SX)$. However, this is not true in general... Also, $\pi_n(\mathbb{Z}SX)$ is often really hard to calculate! Luckily, as a corollary of the Dold-Kan correspondence, we have the following:

From how we've explained it, it is clear that $\pi_1(\mathbb{Z}SX) = H_1(\mathbb{Z}SX)$. However, this is not true in general... Also, $\pi_n(\mathbb{Z}SX)$ is often really hard to calculate! Luckily, as a corollary of the Dold-Kan correspondence, we have the following:

Theorem Let X be a topological space. Then $\pi_n(\mathbb{Z}SX) = H_n\left(\bigcap_{i=0}^{n-1} \ker(\delta_i : \mathbb{Z}S_n X \to \mathbb{Z}S_{n-1}X)\right)$

Why bother with Homotopy?

• Homotopy captures more information about the space than homology.

Why bother with Homotopy?

- Homotopy captures more information about the space than homology.
- This whole correspondence can be abstracted: for a much more general object called a simplicial object A of the abelian category A, we define

$$\pi_n(\boldsymbol{A}) := \boldsymbol{H}_n\left(\bigcap_{i=0}^{n-1} \ker(\delta_i : \boldsymbol{A}_n \to \boldsymbol{A}_{n-1}\boldsymbol{X})\right)$$

うして 山田 マイボマ エリア しょう

This allows us to do homotopy theory in a more general setting.

Why bother with Homotopy?

- Homotopy captures more information about the space than homology.
- This whole correspondence can be abstracted: for a much more general object called a simplicial object A of the abelian category A, we define

$$\pi_n(\boldsymbol{A}) := \boldsymbol{H}_n\left(\bigcap_{i=0}^{n-1} \ker(\delta_i : \boldsymbol{A}_n \to \boldsymbol{A}_{n-1}\boldsymbol{X})\right)$$

This allows us to do homotopy theory in a more general setting.

• Abstract homotopy is useful in many other areas, such as computer science and logic with the invention of Homotopy Type Theory.
